

aXsGUARD Identifier

A Dedicated and Easy to Maintain Authentication Solution

aXsGUARD is VASCO Data Security's product line of authentication and Internet security appliances. Based on IDENTIKEY Server, aXsGUARD Identifier offers strong user authentication for local and remote access to the corporate network and to web-based business applications. aXsGUARD Identifier is highly suited for all enterprises that are looking to acquire a dedicated appliance for their authentication needs, avoiding the hassles and cost of installing and maintaining a software-based solution.

aXsGUARD® Identifier offers the full functionality of IDENTIKEY® Server in an integrated, easy to maintain, 19" rack mountable appliance. Identifier allows easy installation, configuration, administration and maintenance of IDENTIKEY. In combination with any DIGIPASS® authenticator, it replaces the users' static passwords with one-time passwords (OTP) to access the corporate network and its business applications from any remote location.

DEDICATED PLATFORM DESCRIPTION

aXsGUARD Identifier comes as a standard appliance that fits into any 19" equipment rack. It is a complete authentication server offering with all software pre-installed. Besides offering full IDENTIKEY functionality, Identifier comes with a separate appliance administration interface as well as automatic upgrade and backup features.

As Identifier is not depending on external software, it offers a fixed and optimized performance. Deploying Identifier is as easy as deploying a plug and play device: just install the appliance in your infrastructure, configure the front-end and back-end interfaces, import the user data and DIGIPASS and the authentication server is operational.

SCALABILITY

aXsGUARD Identifier comes in multiple hardware versions, addressing the needs and required performance levels of the smallest SME to the largest multi-national. The criteria for the selection among the different models is the number of actual users that will use the authentication system.

- The **AG3442** targets smaller businesses or small remote sites.
- The **AG5502** is a standard 1U 19" rack server, suited as main appliance for all business environments.
- The **AG7552** is a complete redundant 2U, 19" rack server for large enterprises or business critical applications.

Every model allows server failover and database replication towards any other Identifier appliance, ensuring the highest availability and adjusted performance at remote sites, resulting in zero downtime and permitting the setup of a back-up site and global deployment of the authentication system.

COMMERCIAL OFFER

In order to setup a complete authentication solution, every Identifier appliance needs to be complemented with additional IDENTIKEY licenses and DIGIPASS authenticators. These can be purchased as separate components, or are conveniently available out-of-the box as DIGIPASS Packs.

IDENTIKEY Server is available in several editions, offering dedicated functionality, such as RADIUS support, Desktop Windows login, Backup Server, Internet Application login, ect.

The complete solutions, containing the Identifier appliance, IDENTIKEY licenses and DIGIPASS authenticators, are available for single or dual appliance setups.

CONVENIENCE

The main driver for choosing an appliance-based solution is user convenience. In aXsGUARD Identifier, all administration functions are conveniently accessible through a web-based user interface. A variety of wizards help administrators setup aXsGUARD Identifier in a short time, and help performing other complicated tasks. Difficult configuration tasks like setting up replication between multiple aXsGUARD Identifier appliances can be done with a few simple clicks. Automatic updates, both online and offline, with a complete fail safe mechanism keep Identifier up-to-date with the latest software changes with a minimum effort and risk. Optional remote support can be offered as part of the maintenance agreement.

With aXsGUARD Identifier, VASCO® is offering an appliance based strong user authentication solution that is up and running with minimum delay and that offers the lowest Total Cost of Ownership (TCO) by significantly reducing the maintenance costs.

ADDITIONAL BENEFITS

- Self registration allows end-users to activate the DIGIPASS devices via a secure website without administrative intervention.
- The embedded LDAP Synchronization Tool enhances security and minimizes the administrative tasks of user management. Updates on the user management in Microsoft Active Directory, Novell e-Directory or any other LDAP depository are automatically synchronised towards Identifier. Adjustable filters allow specifying which (groups of) users need to be synchronized and it is possible to synchronize multiple LDAP domains with only one Identifier.
- The audit console monitors incoming and outgoing RADIUS and web authentication requests. An extensive search mechanism, displaying auditing lines on the fly, helps administrators to quickly solve possible authentication issues.
- The delegated administration feature allows administrators to delegate tasks like user or DIGIPASS management or reporting without endangering the appliance runtime environment.
- The webbased nature of the administration interface allows remote or outsourced administration, offering new opportunities for managed services providers.
- Functionality information statistics provide critical details allowing administrators to easily manage the remote access environment.
- Standard or customized reports can be created and exported, in both CSV and XML format.
- Extensive log searching and the possibility to export the log search to an external syslog server are provided.
- A flexible license system allows easy expansion of users and DIGIPASS
- Optional lifetime hardware maintenance ensures your appliance (hardware and software) is never out of date.

SPECIFICATIONS	AG3442	AG5502	AG7552
Recommended users RADIUS/DAWL*	500/250	10.000/1.000	100.000/10.000
